

Module 1 – Prompt Development Exercise

Student: Xyrus felix oso

Section: BSIT

1. Task

The AI system should help the student understand the basic concept of machine learning, including how computers learn patterns from data and use those patterns to make predictions or decisions.

2. Audience

The intended audience is a first-year student with little or no background in AI or machine learning. The explanation should be short, clear, simple, and beginner-friendly, using easy examples and avoiding complicated technical terms.

3. First Prompt

Explain the fundamental of programming to a First year student and use simple and clear language and include one easy real-life example. Keep the explanation short, around 1–2 paragraphs.

4. AI Response Evaluation

Machine learning is a type of artificial intelligence that allows computers to learn from data and

improve their performance without being directly programmed for every task. Instead of following only fixed instructions, the computer looks for patterns in information and uses those patterns to make predictions or decisions.

For example, an email app can use machine learning to detect spam messages. By learning from many examples of spam and normal emails, it can recognize patterns and automatically move suspicious messages into the spam folder.

5. Automatically Correct?

no

6. Verification Checks

I would check if the information is accurate and correct.

I would check if the explanation is clear, simple, and appropriate for a first-year student.

7. Improved Prompt

Explain the basic idea of machine learning to a first-year college student with no background in AI. Define machine learning in simple words, explain briefly how it works, and give one common real-life example. Avoid technical jargon, keep the explanation accurate and easy to understand, and limit the response to two short paragraphs.

8. Improvement Reason

I made the prompt more specific by asking the AI to include a simple definition, a short

explanation of how machine learning works, and one real-life example. I also added instructions to avoid technical terms and keep the answer to two short paragraphs. These changes should make the response more focused, accurate, and easier for a beginner to understand.

9. Human Review

I would review the accuracy of the information most carefully. AI can sometimes provide incorrect, incomplete, or misleading information, so I would make sure that the explanation of machine learning is correct before sharing it with others.

10. AI Help / Human Responsibility

AI can help by creating a simple explanation, giving examples, organizing ideas, and making difficult concepts easier to understand. However, a human should still be responsible for checking the accuracy, relevance, and quality of the response and deciding whether it is appropriate for the intended audience.

11. Reflection

I learned that a clear and specific prompt can produce a better AI response. Adding details about the audience, purpose, format, and type of explanation helps the AI understand what is needed. I also learned that AI responses should not be accepted automatically. They should always be reviewed and evaluated by a human before being used or shared.

 **Congratulations! Activity completed.**
